

Asian Cockroach Identification and Biology

By DoMyOwn staff

Physical Appearance

- The Asian Cockroach is almost exactly identical in appearance to the German Cockroach, and about 5/8 inches long
- The Asian Cockroach may be slightly lighter in color than the German, with slightly longer and narrower wings.
- Another distinguishing characteristic of the Asian Cockroach is that it will take flight when disturbed, even during the day, whereas German roaches rarely (if ever) fly.

Behavior & Habitat

- The Asian Cockroach is capable of sustained flight for up to 150 feet
- The Asian Cockroach becomes active at dusk, and is attracted to light reflected off doors and windows.
- Asian Cockroaches prefer the outdoors, but will try to enter lighted homes and buildings at night if those buildings are accessible.

Feeding Habits

- Asian cockroaches feed on garbage and human food, preferring starches, sweets, meats, and grease.

Reproduction & Life Cycle

- Females may produce up to 4 egg cases in a lifetime, each case containing up to 45 young roaches.
- On average, it takes 67 days for an Asian nymph to reach adulthood.
- Female Asian Cockroaches live for about 104 days, while males live about 50.
- Adults are most often seen during the spring and fall, while nymphs are more predominant in the summer and winter.

Basic Control Methods

- Limit outdoor lighting from dusk until 3 hours after sundown.
- Broadcast a granular (such as [Talstar](#)) over lawns and shrubs where Asian Cockroaches may harbor.
- Spray actual siding and lawn up to 6 feet out from siding with [Suspend SC](#), [Demon WP](#), or [Talstar](#) to create a protective barrier and prevent future entrance
- For indoor control, use [Maxforce Gel Roach Bait](#) in infested areas. Do not spray the same area where bait is being used.
