

How To Treat Ant Colonies

By DoMyOwn staff

Indoor and Outdoor Ant Colony Treatment

- Nests in Structural Voids should be treated with <u>Delta Dust Insecticide</u>. If the existing point of entry is not large enough to inject the dust, a hole may be drilled and later repaired. Apply Delta Dust in a thin layer (generally 2 to 3 puffs) using a <u>Hand Duster</u>.
- Nests in Wood such as structural timbers, fence posts, tree holes, stumps, or logs, should be treated the same as those in structural voids, using <u>Delta Dust Insecticide</u> and a <u>Hand Duster</u>. Holes may be drilled for easier access.
- Nests in Soil (includes ant colonies located in lawns, flower beds, or underneath stones and rocks)- Drench mound with a water-based liquid insecticide such as <u>Cynoff WP</u>, <u>Suspend SC</u>, or <u>Talstar One</u>. You will also need a<u>Chapin</u> <u>SureSpray 1 Gal Sprayer</u> for mixing and application. Usually only a few ounces is needed, but follow the product label.
- Nests in Landscape Mulch may be treated with a liquid insecticide such as <u>Cynoff WP</u>, <u>Suspend SC</u>, or <u>Talstar One</u>. You will also need a <u>Chapin SureSpray 1 Gal Sprayer</u> for mixing and application. Since mulch is thick and difficult to penetrate, first rake back the mulch to expose the ant colony before treating.
- Nests in Slab Foundations are typically difficult to access, and baits would be the ideal treatment (see step 4). If baiting is unsuccessful, a number of holes may be drilled in the foundation through which a termiticide labeled for application under slab foundations can be used. Termidor SC is an excellent option for such cases.
- Nests in Stack of Lumber, Bricks, or Other Materialcan be treated by unstacking the materials in order to expose the colonies, then drenching the mound(s) with a liquid insecticide such as <u>Cynoff WP</u>, <u>Suspend SC</u>, or <u>Talstar One</u>, You will need a <u>Chapin SureSpray 1 Gal Sprayer</u> for mixing and application.
