What are Crazy Rasberry Ants?

Crazy Rasberry Ants are a new invasive pest species first identified in and around Houston Texas in 2002. Since that time the infestation in Texas has grown encompass 11 counties and are a real problem for homeowners. These ants have not been identified to species but are commonly called crazy Rasberry ants after the exterminator who first noticed them.

How to Identify Crazy Rasberry Ants

- · They will show up in extremely large numbers, even millions to billions
- · Ants are uniformly sized at about 1/8 inch and reddish-brown in color
- · They do not form trails but instead move about rapidly and erratically
- They seem to have an unexplained attraction to electrical equipment such as computers, hair dryers, and air conditioners. In some instances large enough numbers have accumulated to cause short circuits and ultimately equipment failure.

Crazy Rasberry Ant Nests & Colonies

Crazy Rasberry Ant nests are can be found underneath or inside of practically any object or void including soil, concrete, stumps, potted plants, etc. and especially objects containing moisture. Nests usually occur outside with worker ants foraging inside homes and buildings.

Crazy Rasberry Ant Feeding Behavior

Crazy Rasberry Ants are omnivorous and will eat almost anything. Known food sources include small insects and vertebrates, sweet parts of plants, and over-ripe or rotten fruits.
